

A Review of the
Toronto Faculty of Dentistry Research Institute Clinic

Executive Summary

Clinical research activity within the Faculty of Dentistry at the present time only represent about 13-15% of the total research activity, based on both publication and research dollar activity. Yet, the Canadian Institutes of Health Research are currently calling for an increased amount of clinical research and translational activity within Canadian Universities. This places our faculty in a position where it will not have the means or capacity to capitalize on new opportunities that will emerge from both government and corporate sources if it does not take proactive measures to change its way of thinking, planning and execution on activities which support and promote clinical research within the Faculty.

In recognition of this situation, the 2004 Faculty of Dentistry academic plan for research called out an initiative to review the current status of the Research Institute Clinic (RIC) within the Dental Research Institute (DRI).

The current document contains the elements of this review and recommends an immediate change to the management structure and space allocation of the RIC. It further recommends an increased engagement of all clinical faculty in the process of clinical research activity, with the goal of accommodating an active and high clinical impact program within the new Faculty of Dentistry building.

1. Introduction

Much of the Faculty of Dentistry's research program operates today within a virtual research institute called the Dental Research Institute (DRI). DRI was formed in 1998 to find integrated solutions to health problems, and to accelerate discovery in oral health while also advancing prevention, diagnosis and treatment in areas beyond teeth and gums alone. It was formed out of recognition that the Faculty needed a more efficient manner in which to streamline research support costs, enhance communications among its investigators, and make better use of its building infrastructure if it wanted to compete with the leaders among the world's best public teaching and research universities, with respect to its discovery, preservation and sharing of knowledge, its teaching and research, and its commitment to excellence and equity. DRI is already unique in Canada for its strengths across basic science (laboratory research), clinical studies (testing treatments that are nearing application in patients) and applied technologies (translation of the basic and clinical into commercial/industrial application). The 2004 Academic plan called for the Faculty of Dentistry to engage in taking full advantage of the DRI concept to implement a plan of growth and sense of ownership by its stakeholders. DRI's greatest asset is its diversity (its faculty members are an interdisciplinary mix of health care, social scientists, engineers and basic scientists coming from a range of ethnic and training backgrounds) and growth should be built upon this attribute.

An important element of DRI's academic plan relates to the **translation of research** into the clinic. A pivotal aspect of this involves the ability to engage in clinical research at a significant level. If health care and biotechnology is going to be the next economic driver of our society then our vision must be to build today the opportunities for divesting our inventions and technologies via our clinic business operations. DRI has called out to achieve this by:

- use of its new research grants endowment fund which has now raised close to \$500,000 and is on target to achieve its goal of \$5,000,000 within the next 10 years.
- improving our research facilities through the planning of a new Faculty of Dentistry.
- Familiarizing our Faculty with the activities of the Innovations Foundation and highlighting the benefits that are derived from the translation of our research. As well, to engage faculty in contract research activity and familiarize them with the universities procedures to facilitate the advancement of translation with the simultaneous publication of clinical research findings.
- providing DRI members with a policy on translational activities within DRI and related to spin-off companies in order to take advantage of the new MaRS facility on campus. This facility (located at the corner of College and University, across from the proposed new sight for the Faculty of Dentistry) is specifically designed to assist with the start-up of new companies on campus.
- Finally and perhaps most importantly, promoting the use our Research Institute Clinic (RIC) to carry out clinical studies with industrial and other collaborators in conjunction with our tenured and non-tenured staff.

It was recommended in the [[2004-2010 Faculty of Dentistry Academic Plan](#)] that a review of the current RIC be undertaken in order to establish a Centre of Excellence in Oral-Facial Rehabilitation that would be initially recognized provincially but would establish a longer term objective for that recognition to become global. This would become a corner-stone feature to attract investment towards the Faculty. This strategy has already begun to demonstrate success with the announcement of the Nobel Biocare Chair in Prosthodontic Surgery, now taken up by Professor Asbjørn Jokstad.

Dr. Jokstad was assigned in December 2005, by Dr. Santerre (Director of the DIR) and the Interim Director of the RIC, Dr. Tenenbaum to chair a committee to review the current RIC operations. The mandate of the committee was to:

- Review current operation of the RIC with respect to
 - use of faculty resources
 - ability to service the clinical research faculty
 - assessment of Faculty resources not currently in use
 - general operation procedures.
- Provide a review of academic strengths within the faculty that could complement the RIC in terms of making it an attractive site for companies and investigators to carry out clinical research within the faculty premises
- Provide a clear plan with respect to future operations, including administration, service support, cost recovery, promotion, effective use of resources and future building planning.
- Ensure a comprehensive review in its assessment of the whole faculty and clinical investigators affiliated with the faculty.
- Generate a final report with a plan for operations of the RIC and recommendations for implementation of the plan along with a time frame for its implementation.

A committee was established in December 2005, consisting of Dr Limeback, Dr Locker, Dr Santerre, Dr Tenenbaum and Dr Valenzano. When it became clear a few months later that the planning for a new faculty building was underway, the committee was also tasked to address the role of RIC within the confines of the new faculty building. Consequently, Dr Watson as head of the new faculty building committee was also invited to attend the committee meetings. The initial time frame for the committee report was initially set for completion in December 2006, but this was changed to the July 2006 in order to provide input to the imminent room planning for the new dental faculty building.

[Go to top](#)

2. Current clinical research within the Faculty and the RIC

2.1 Research activity

In 2004, about 100 papers were with one or more coauthors from the Faculty of Dentistry [[Publications 2004](#)]. The list reflects the research profile of the faculty of dentistry over the last few years, which is an emphasis on basic research, mainly in the field of biology. The list also includes a few clinical trials, various epidemiological research and some education and materials sciences papers. The 2005 annual report of the Dental Research

Institute provides some further detail on the basic research [\[DRI 2005 report\]](#). The percentage distribution of the above areas is basic (58%), clinical trials (15%), epidemiological research (10%), and education/reviews (17%).

Another index for research activity is the number of new patents. As patents can only be granted when the research findings are not in the public domain, the number of papers from some of the faculty of dentistry research groups could probably have been higher than currently reported. The Faculty of Dentistry currently has several patents filed and technology transfer agreements with companies. Specific examples of such activity are listed in Table 1.

Table 1: Examples of faculty with licensed or assigned technology

Faculty member	Type of agreement (license or assignment)	Company or Institution who has acquired rights to IP	Status (active, on-hold or non-active)
J Paul Santerre	Assignment	Interface Biologics Inc.	Active
John E. Davies	Assignment License License	Millennium Biologix Inc. BoneTec Corporation Tissue Regeneration Therapeutics Inc.	Active Active Active
Robert Pilliar		Innova LifeSciences Corp	
Dennis Cvitkovitch	License	[KaneBiotech]	Active
Celine M. Levesque	License	[KaneBiotech]	Active
Howard Tenenbaum	Patent/License (resveratrol)	INSERM, France	Active

2.2 Facilities and staffing

Clinical research can currently, in theory, be conducted in any of the undergraduate student clinics, the postgraduate clinics, the affiliated university hospitals and in the current RIC. In this last clinical environment, the oral research clinic (ORC) is currently a major program. In practice, it is very difficult to initiate and carry out a clinical study in any of these settings. There are several key reasons for this and they include:

- Absence of a well defined financial model for cost recovery of research activity within the context of the cost recovery model for the teaching clinics.
- Lack of identified resource team to assist with appropriate costing for projects prior to start.
- Current use of the RIC resources for teaching and continuing education rather than establishing research projects as its priority.
- lack of appropriate staffing
- lack of a financial plan for directed growth and activity priorities
- shortage of dedicated infrastructure facilities

2.3 Funding

A number of current researchers and research groups in the faculty of dentistry receive funding from public and commercial sources. Based on information found on the faculty public domain website and the 2005 research day abstracts 36 individuals were identified with such funding: [Research funding 2005-2006]

There is currently little funding directed towards clinical research at this time. The distribution of funding through the DRI for basic, translation and clinical studies is about 70%, 17% and 13% respectively.

Moreover, the few clinical studies that have been published acknowledge, with a few exceptions, no sponsoring body. This is perhaps not surprising given the nature of the trials; i.e. largely retrospective cohort studies and very few clinical experimental trials. This situation reflects primarily the fact that there has previously not been a concerted effort to obtain such funding. An anecdotal list of some lost funding opportunities are given below, in alphabetical order:

1. The 3i Corporation has for years funded much basic research, but no translation studies.
2. In 2004, Colgate wanted to carry out small studies (60-100 patients) to obtain feedback from patients following a changing of flavors and therapeutic formulations in their toothpaste. The absence of infrastructure to enable a quick move on these studies resulted in a lost opportunity for investigators in the preventative unit.
3. Phillips & Gillette approached the faculty to appraise sensitivity following toothbrush use, but again timing and limited resources delayed this opportunity.
4. Straumann agreed to sponsor a trial on implant placement in elderly patients, but the study was until recently put on hold.

A more concentrated effort to impress these companies of the strengths of the Faculty and the position of Toronto as a clinical trials centre must be undertaken and resources to support this must be identified.

2.4 Current Research Institute Clinic

The RIC was formed during the 1998-2003 academic planning cycle. Its original intent was to provide a unique facility within the DRI which would promote and facilitate the conduct of clinical research. This was primarily driven by investigators in the periodontal unit which did not have a facility to conduct their implant research program. The Director of the DRI at that time, Dr. Johan Heersche, facilitated the formation of the unit by providing the group with space and the use of their overhead funds to remodel clinical rooms on the 3rd floor of the Faculty. Management of the RIC up to this point has focused on creating a presence of activity, currently dominated by projects from the Department of Periodontology, for historical reasons. There have been limited resources available to dedicate the facility towards a broad Faculty service.

The RIC unit was originally set up for the purpose of conducting experimental clinical research. Today, the major activity relates to work within the Oral Research Clinic program (ORC). However, this program, while originally established to carry out implant studies, consists mainly of implant surgery as part of the postgraduate training of residents in periodontology and continuing education for foreign dentists. The ORC

activity is run efficiently from a clinical staffing perspective and the current administration of the patient flow is conducted in-line with the faculty clinics guidelines, although the reconciling of cost recovery has been challenging. The [\[RIC clinic layout\]](#) consists of 6 operatories with an extensive [\[clinical inventory\]](#).

The current Director of the RIC is Dr. Howard Tenenbaum who reports to the Director of the Research Institute on Research matters. The unit is one of 6 operating services within the DRI and it is by far the most complex both in terms of resource management and diversity of activity. There has been since the beginning of the RIC, a lack of discipline in terms of reporting on financial management, forward planning and execution of strategic plans on behalf of all members of the DRI. This is reflected by the historical circumstances under which the RIC was established.

The day-to-day administrative support is currently coordinated by Mary Lino, Team Leader RIC Clinic. While it was originally intended that this position should be reporting to the Director of the RIC, more recently due to administrative restructuring, the position more or less reports to the investigators carrying out Implant research. Presently, the Team Leader is involved in day to day administrative support and also serves as receptionist and occasional dental assisting duties. The current staff consists of an additional four dental assistants. The current emphasis on surgical oral procedures (namely, implants) in the RIC presently necessitates the need for highly qualified and skilled clinical support staff with specialty skills in greater numbers than in a normal clinical setting. Approximately two-thirds of the current staffing is primarily involved in clinical activities outside of their role in direct clinical research.

The time commitment for a typical week consists of the activities shown below:

A typical [\[weekly time schedule\]](#) shows a very high amount of activity related to postgraduate periodontics and continuing dental education.

[Go to top](#)

3. Regulatory directives / good clinical research practice

3.1 Good clinical research practice

Health Canada has issued through their various directorates a number of guidance documents on proper and ethical methods for clinical trials. The main guidance document is the “Food and Drug Regulations for Clinical Trials Guidelines” [[Canada trial guidelines](#)], which can be downloaded from Health Canada: [[Regulations Amending the Food and Drug Regulations \(1024 – Clinical Trials\)](#)].

Other guidance documents have also been prepared to assist in the interpretation of policies and governing statutes and regulations. They are intended to assist in preparing the various device license applications required when seeking an authorization to sell a medical device product in Canada. Central documents related to clinical trials are:

1. [Guidance for Records Related to Clinical Trials \(GUIDE-0068\)](#)
2. [Inspection Strategy for Clinical Trials](#)
3. [Preparation of an Application for Investigational Testing – Medical Devices V.3](#)
4. [Preparation of an Application for Investigational Testing – In Vitro Diagnostic Devices V.3](#)
5. [Application for Investigational Testing Authorization](#)
6. [Registration and Disclosure of Clinical Trial Information](#)
7. [Other Guidance Documents on Medical Devices](#)
8. [Other guidance Documents on Drug Products](#)

Canadian regulations are fairly similar to European policies although somewhat stricter regulations for regulating clinical trials on medicinal products were set forth by the EU commission, which became mandatory from 1st May 2005 [[EU directive](#)]

The implementation of Bioethical considerations are monitored by the existing Faculty research committee for most of the current activities. Protocols are approved in conjunction with the University of Toronto’s [[human ethics approval](#)] process.

[Go to top](#)

4. Essential needs for the conduct of good clinical research practice

Clinical studies require a clinical environment with (a) adequate and trained staff, (b) appropriate clinical and research equipment, (c) allocated research space and (d) established standard operating procedures.

4.1 Staffing, clinic and administrative management

Clinical staff is required to follow established operating routines for patient recall, examinations, registration and patient information.

Statistical expertise for support in the planning and executing stage of clinical trials will have the potential to greatly enhance the quality of trial conduct. When conducting clinical trials, a number of pitfalls can be identified [[Clinical Trial Pitfalls](#)], and at least one resource person should be employed that can assist the clinicians in addressing such

issues on a full time or part time basis, both in the planning stage of the projects and during the projects.

One of the major obstacles for conducting trials is the time and the specific competency required for writing comprehensive grant applications. It would seem very cost-effective to staff the research clinic with a person who has demonstrated skills and practice in grant writing. Whether this person is DDS trained or not is nonessential.

4.2. Infrastructure, clinic and research equipment

A research clinic should consist of standard dental operatories, preferably equipped such that only tools and apparatus specific for the conduct of the particular trial occupy the space. The clinic equipment and according layout will vary and depend on trial protocol. The operatories must therefore be flexible to adapt to various project possibilities. Appropriate research equipment needs to be identified in consultation between clinician-researchers and basic scientists. It is necessary for basic scientists and clinicians to consult regularly to clarify the potential benefits and potential uses that new and advanced research equipment may have for clinical research. Research equipment and devices currently in use in different research centers are listed separately: [[Research Equipment](#)]

4.3 Space

Regardless of the number of clinical operatories, each operatory requires additional space compared to the commonly used 3x4 meters layout. The additional space is required for placement of various additional recording or diagnostic devices, and/or an additional person for recording purposes. Moreover, there is a need for additional work bench area to allow for the placement of extra devices that may be required for a given study, in addition to the recording equipment. Finally, a large array of different size drawers and cabinets for storage should be available.

4.4 Standard operating procedures

Standard operating procedures (SOP) for good clinical research practice have to be established and made according to the Health Canada guidelines detailed in this document. Typical issues that need to be addressed are detailed in Table 2.

Table 2. List of clinical trials standard operating procedures examples

Topic	Areas to address
General Administration	Sop on Sops: Preparing, Maintaining & Training Responsibilities of the Research Team Training and Education
Subject Management	Subject Recruitment and Screening Informed Consent Development and Implementation Subject Management While on Study Adverse Event Reporting Specimen Collection and Hospital/Central Laboratory Procedures

[Go to top](#)

5. Potential future clinical research areas

Clinical research can be identified as research where the unit of measurement is a human subject or some part of a human. In practice, this encompasses designing and executing clinical experimental trials (A). An alternative and complementary research approach is where patients receive some form of care and the process, the participants or the equipment and/or the work environment is being monitored (B).

5.1. Clinical experimental trials

The 2004 publications list from the faculty of dentistry provides some suggestions for feasible clinical experimental trials. The faculty needs to undertake an initiative to visualize and promote the strong basic sciences background contained within the faculty in order to hopefully attract interest for more translational research from potential sponsors and possibly for other grant funded clinical experimental trials (Table 3).

Table 3. Possible future clinical research areas

Patient / Condition	Study focus:			Remarks:
	Etiology / Harm	Diagnosis –establish sens. / spes.	Intervention (prevention / therapy)

	•Fluoride – association with systemic illnesses		exposures	
General health		•Saliva tests		

5.2 . Design and development of a clinical environment that may enable testing of devices and equipment used in dentistry

There is currently no independent reliable centre or organization in Canada that can provide guidance to dental care workers or industry regarding merits of dental products, - materials and –devices. The only such centre in North America is the [[Paffenbarger Research Centre](#)], which is jointly sponsored by American Dental Association, the US National Institute of Health and the National Institute of Standards and Technology. Another similar centre in Europe is the [[Nordic Institute of Dental Materials](#)]. These centers conduct testing and certification according to established standards, as well as participate in developing new international standards. According to the current chairman of the relevant dentistry technical committee in ISO, ISO TC106, Dr Derek Jones, there was a political endorsement to establish such centre also in Canada some years back, but the opportunity was subsequently lost.

The dental industry is eager to establish whether their products satisfy adaptation to the appropriate ISO requirements if such exist. Moreover, they often rely on quality feedback from customers and consultants regarding potential users’ requirements for e.g. ergonomics, health and safety, infection control possibilities, etc. Such feedback can be generated in institutions where there are many clinicians undertaking a large number of patients requiring a varied number of therapies; e.g. such as can be found in a faculty clinic. The future faculty of dentistry should consider staffing the clinic with an adequate number of supplementary engineers and other relevant personnel to enable establishing a centre that can specialize in product testing and product improvement.

It would be advisable to contact the Canadian association of dental manufacturers to establish whether such a centre would be sustainable with or without direct funding from the industry. A centre for such activities would also possibly open for collaborative projects with other University of Toronto institutions relevant to the contextual subject, and perhaps even funding from sources that traditionally have not been tapped into by the dentistry faculties. A list of possible areas for conducting such evaluations are provided in Table 4.

Table 4. Possible areas for conducting clinical testing / studies

Clinician large equipment, ergonomics, etc.	Clinician small equipment, user feedback	In office equipment, efficiency, safety etc.
<ul style="list-style-type: none"> • Dental units • Unit lightning • Delivery units 	<ul style="list-style-type: none"> • Rotary instruments • Scalers • Fiberoptics 	<ul style="list-style-type: none"> • Compressors • Vacuum systems • Pumps

<ul style="list-style-type: none"> • Patient seating • Operator seating • Cabinetry • Waterline contamination • Anesthesia equipment • Etc. 	<ul style="list-style-type: none"> • Rotary burs • Small diagnostic and therapeutic devices • Etc. 	<ul style="list-style-type: none"> • Suction • Amalgam separator • Operatory lightning • Etc.
---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	-------------------------------------------------------------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------

5.3 Funding possibilities

Potential current possible opportunities for funding are from both companies and public:

5.3.1. *Company funding opportunities*

- Curazone Company, ozone use for prophylactic reduction of caries activity
- Halitosis studies are often sponsored by large global manufacturers
- Nobel Biocare has indirectly sponsored several implant studies originating from the Implant Prosthodontic Unit (IPU).
- Ondine, British Columbia, has voiced an interest to sponsor trials on light activated drug for periodontitis
- Pharos technologies, light activated drug
- Straumann/Biora, may be willing to sponsors studies on the effect of Emdogain on hard and soft tissues
- Kane Biotech in the area of antimicrobial peptides.

5.3.2 *Public funding opportunities*

- CFI, requires seed money for building infrastructure. This requires matching funding from others, e.g. from company.
- Government and insurance agencies are interested in establishing the cost effectiveness of different modalities of treatment
- CIHR, from the perspective of establishing optimal recall rates and therapeutic delivery studies
- Veterans affairs, from the perspective of cost containments
- First nations, from the perspective of cost containments
- RCMP, from the perspective of cost containments
- National Clinical Survey, could the clinic be used as a centre for calibration?

5.3.3 *Other funding opportunities*

A systematic review of former IADR and AADR abstracts can be undertaken to identify:

- a) which funding sources Canadian investigators have had access to, and
- b) which are the biggest commercial sponsors in North America, and which are their areas of interest for sponsoring, as well as determining whether any of these sponsors have demonstrated previous support of researchers from Canada.

ISO TC106 dentistry has shifted the secretariat from UK to Canada in 2004. It is now hosted by the Canadian Dental Association (CDA), and there is good reason to believe that it would be of interest to this new secretariat to assist in establishing some sort of

dental “testing facility” for many of the standards that are under constant review within the ISO TC106 activities (List of ISO standards: [\[ISO Standards\]](#)).

A tentative list of potential commercial sources for funding is available on the sp website: [\[Manufacturers N. America\]](#)

[Go to top](#)

6. Viable initiatives that may improve clinical research activities

6.1 Undergraduate training

The Faculty of Dentistry has a very active summer student program that is administered through the DRI by the Summer Student Coordinator (currently Dr. Michael Glogauer). In this past year this program has been integrated with another CIHR training grant dedicated to recruiting the strongest undergraduate students from across Canada. The program’s name is Network of Oral Research and Training in Health - [\[NORTH\]](#).

Each summer a few of the 25-35 undergrad students that are engaged in research have the opportunity to participate in clinical research. However, these numbers are very limited in comparison to the total number of undergraduates that are in the DDS program. The current academic plan calls for instilling a culture of research throughout the whole education program in the Faculty. Specifically, at the undergraduate level there is activity in progress to establish an undergraduate research curriculum that would produce a credit course for which all undergraduate students would have access to. This initial concept of the program was presented to the Faculty’s undergraduate curriculum committee in the Fall of 2004 by Dr. Bernhard Ganss and Dr. J Paul Santerre, and the idea was endorsed however a curriculum needed to be developed that could accommodate all students equally. The following benefits will come from this initiative:

- increase motivation of students to participate in research for academic reasons
- indication of the Faculty’s interest to offer academic research as an alternative career path
- recognizes a comprehensive training that we provide for students on the ethics of science, publication writing, project design, public presentation, use of computer tools for communicating research, exposure to the broader area of dental research, conveying the importance of collaborative research, promoting the exposure of students to international dental research.
- A program for credit would clearly set out requirements that would motivate students to participate in all aspects of the program.
- promote the use of personal guided research in the regular curriculum
- It would allow the Faculty to recognize undergrad research achievements at annual graduation ceremonies.

A current aspect of this program which is requiring some thought is the method by which all students could accomplish their research requirement in the curriculum, since there are only 20-35 research projects run each summer in the Faculty. If students could

participate in a clinical research project throughout the school term via projects being carried out within the RIC, then this could be used to satisfy the research time requirement that would be set forth in the research curriculum component.

The above initiative will be further pursued in the Fall of 2006 in order to attempt to begin implementation with first year students in the Fall of 2007. The contacts for this initiative are Dr. J Paul Santerre and Dr. Michael Glogauer.

6.2 Graduate training

At the graduate level, DRI will focus on ensuring that the Associate Dean of Graduate Studies receives our full support with the further implementation of the mandatory MSc. Thesis within the specialty program. This is key to achieving our objective of being leaders among the world's best public teaching and research universities, in respect to its discovery, preservation and sharing of knowledge, its teaching and research, and its commitment to excellence and equity.

The Faculty has a CIHR training network that is directly associated with the training of PhD students in the area of Pain and Inflammation with a focus on the study of Cell Signaling effects. There are a couple of students in this program that have had clinical research components in their thesis, and which should be encouraged to conduct this research in the RIC.

6.3 Possibilities for GDPs to obtain CE points

A large proportion of the current teaching faculty is non-tenured. One possible strategy for harnessing the creativity of these individuals, particularly in the translation of research to practice or even allowing them to empower our research Faculty with new direction for solving clinical issues in the practical field is to integrate them into the RIC programs by promoting the nature of research project opportunities for them. This can be done via our Faculty website, the Alumni office, or directly in the clinics via our clinical investigators.

[Go to top](#)

7. Recommendations and Schedule for Implementation:

7.1 Within existing confines

The current activity within the RIC should not remain dominated by select graduate training. A research clinic that can provide a multidisciplinary approach and serve all the faculty's clinical research needs must become a central priority.

7.1.1 Staffing, Clinical, administration and management & Public relations

Given the difficulty that the RIC has had in identifying a clear and consistent approach to the development and administration of new clinical research projects it is strongly

recommended the future of the RIC be guided by a management board that is made up of individuals who have a clear understanding of the University's policy on grants and contracts, Intellectual Policy and technology transfer activities.

As well, this board should have representation from the Faculty's Director of clinics since costing operations are currently in place for all the clinic teaching and there could be a significant amount of overlapping activity that would be beneficial to the RIC. A permanent director is needed and this individual should have experience in conducting clinical research studies. Lastly, there should be a permanent manager position established for the day-to-day execution of clinical logistics within the RIC.

The management board formed from the Director of the DRI, the Director of Clinics and the Director of the RIC with the Dean of the Faculty being an ad-hoc member would be chaired by the Director of the RIC and would convene 2-4 times a year to oversee activities and general operating of the RIC to ensure that activities were planned according to the practice of clinics within the Faculty, and the policies administrating research contracts and grants within the University. This committee would decide on where to direct overhead funding brought into the RIC from research projects associated with grant activities carried out in the RIC. Executive action recommended to the RIC by the management board would be carried out by the Director of the RIC with that individual's assigned staff.

All clinical research project proposals must be passed through for review to the RIC Principals/Executive. The proposals should be reviewed to ensure proper clinical research protocols, RIC suitability and clinic operation financial viability have been adequately addressed. To assist with this task a reviewer pool made up of one representative from each clinical division will be made available to the director of the RIC.

A formula needs to be determined for the optimal proportion of permanent support staff for the RIC and assigned and/or hired for a specific research project.

The requirements of administrating an efficient research clinic would best be served if the role of the Team Leader is limited to the administrative duties with occasional dental assistant duties and there is provision for a dedicated receptionist.

The potential for a variety of clinical research activity in the RIC would necessitate the need for retaining staff that are highly qualified with specialized skills and have a diverse dental background. A dedicated dental receptionist should be added to the current complement of clinical support staff to permit the Team Leader / Receptionist to focus more fully on the day to day administrative duties and responsibilities in the RIC. Consideration should also be given to increasing the complement of clinical support staff as the needs of the RIC increases to ensure ultimately at least one dental assistant is dedicated to each operatory.

It is also proposed that we develop a pool of patients who would be willing to participate in, and appropriate for participation in various and sundry clinical research projects that are taking place or being proposed. It is difficult to attract patients just at the time of

inception of any particular program and therefore having such a pool will facilitate the timely prosecution of clinical research projects. Patients should be derived from a variety of resources including the undergraduate and graduate clinical pools. In addition, it is proposed that the RIC actually advertise in professional publications as well as newspapers (including the so-called subway newspapers) on a regular basis in order to attract potential generic recruits as well as those patients who would be suitable for already identified clinical research programs.

7.1.2 Infrastructure

A potential model of an efficiently run clinical research clinic is detailed in a separate graphical figure: [\[RIC Model\]](#)

7.1.3 Standard Operation Procedures and Space Requirements

There is a need to establish standard operating procedures (SOP) for good clinical research practice according to Health Canada guidelines and adapted to suit the special circumstance of the RIC with the Faculty of Dentistry. The director of the RIC should oversee that all SOPs are followed, while another committee will need to audit. This task could perhaps be delegated to a committee formed from members of the Faculty's Research Committee and members of the Clinical Management staff in units outside of the RIC but within the Faculty.

The RIC is presently running at capacity and is currently undertaking a very limited amount of clinical research. Resources and space limitations within our present building do not allow for expansion of the existing facility. Therefore, change to the existing schedule of clinical activity must be seriously considered to ensure the future viability and success of a clinical research facility at the Faculty of Dentistry, University of Toronto.

7.1.4 Consequences of changes

It must be recognized that the changes that are being proposed in this document will also have effects on other parts of our faculty. We propose that all Graduate level implant and reconstructive dentistry training currently being carried out in the RIC be moved, possibly to develop a new collaborative implant dentistry training program (possibly in the IPU). Although this unit was developed for several purposes, those being training, service and prospective research data collation and analysis, this program does not necessarily need to be done in the RIC. Similarly, there is a continuing dental education program that is closely tied to the Graduate Periodontology program as well as to the research activity mentioned above. This program would also be expected to move out of the RIC. These moves would of course create more space/time availability for clinical research programs that will eventually develop. However, this leads to an impact on space and time availability in other parts of the Faculty that will have to be accommodated. It is also proposed that other programs, tied to a specific discipline (e.g. Periodontology's Severe/refractory Periodontal Disease Investigation and Treatment Unit) currently in the RIC, but not related to the implant dentistry training/research/CE program continue to operate in this clinic.

The faculty clinics in general are functioning at a high usage capacity so the availability of operatory chairs for clinical research is very limited. The undergraduate clinics would have limited availability of 2-3 operatories in Clinic 1, that are presently designated for undergraduate periodontal surgery. All other undergraduate operatories are in use during the traditional academic year, September – June, however, there would be availability during the summer months. It should be noted that the undergraduate operatories available during this time would not provide a great degree of privacy as the operatories to the most part would be considered open concept operatories. The graduate operatories though more suitable for clinical research would have extremely limited availability due the varied schedules in the graduate programs and also the high usage rate of the graduate clinics. To utilize the graduate clinics would also pose numerous scheduling problems, logistical challenges and seems administratively very difficult to manage.

It would seem logical that the RIC unit, which originally was set up for the purpose of conducting experimental clinical research, should be structured so this once again becomes the primary activity in this unit. This means that the clinic should not remain dominated by projects such as the ORC program which is focused on the surgical training of postgraduate periodontal residents in implants. The latter should be reallocated to the postgraduate periodontology clinic, therefore allowing human resources to be redirected towards new research projects and the relevant clinical research projects that are currently associated with the RIC.

Consideration must be given to decreasing or completely phasing out the Graduate Periodontology and/ or Continuing Education clinical activity in the RIC to allow for increased available time for experimental clinical research and clinical trials.

7.1.5 Financial model

Financial management remains a challenge in terms of project budgeting in advance of the start of new projects. This results primarily from the fact that clear guidelines for project budgeting are not available for PIs wishing to undertake such activities.

When approached by any commercial venture to begin a clinical investigation on any product, there should be a startup fee levied that offsets the efforts required to draft a new proposal. This might not apply to companies that supply their own protocols (e.g. Ondine with Dr Jim Lai as P.I) but even here, the protocols have to be rewritten to improve scientific validity or for complying with Human Ethics issues.

Following approval of a clinical research proposal and upon commencement of the project to ensure the financial stability and viability of the RIC, the following mechanisms should be followed:

- a) All clinic overhead expenses should be identified, confirmed and approved prior to commencement of the project.
- b) Upon commencement of any new clinical research project in the RIC, an invoice would be initiated and forwarded to the principal investigator for the full amount of anticipated clinic overhead expenses for the fiscal year.

- c) All patients must be appropriately identified in Axiom by the Team Leader. Procedural expenses and visits will be tracked in Axiom as well as the appropriate adjustments to the patient chart.
- d) Upon completion of the project, a budget report analysis will be completed and reviewed.
- e) Capital expenditures for the RIC should be addressed by the RIC management board and the PI review committee pool

7.2 New faculty building

In order to truly integrate clinical and basic research sciences with the clinical undergraduate and graduate educational experience it will be necessary to allow for changes in the physical layout of the Faculty of Dentistry. In this regard it is proposed that in the future building provisions should be made to develop clinical and research spaces that are more contiguous. It is suggested in fact that the layout of such space follow the philosophy that pertains to the concept of '*bench to chairside*' research/education/clinical treatment. Hence, it is proposed that newly developed space allow for basic science research laboratories to be, for example, contiguous with the clinics but that in between, we could house translational laboratory facilities. The latter facilities would operate on the principle that patients coming through our Faculty would also be subjects of various clinical/translational research programs. Similarly, the basic research labs would still have communication with the undergraduate and graduate clinical areas but via the translational labs.

The planned room details for the future RIC are described elsewhere: [\[RIC rooms\]](#). These facilities will evolve in concept over the next years and the RIC will engage, with the faculty, in an active campaign of fundraising and achieve the vision of the RIC facility within the new Faculty of Dentistry building.

7.3 Schedule

The following tables (Tables 6 and 7) list the recommendations and planned resource allocation to implement the recommendations (Table 6) and the assignment milestones for implementation of the recommendations over the next 3 years.

Table 6: Recommendations and resource allocations

Recommendations:	Resource Allocation:
7.1.1: Staffing, clinical administration and management & public relations	
1. Establish a management structure	Faculty salaried positions assigned from current faculty and clinic teaching staff
2. Establish a Clinical Project Reviewer Committee	Faculty salaried positions assigned from current faculty
3. Assign current clinic staff allocation as detailed in section 7.1.1	Faculty salaried positions assigned from clinic teaching staff.
7.1.2: Infrastructure	
1. Review and Implement the RIC model	To be determined
7.1.3 Standard Operation Procedures and Space Requirements	
1. Director of RIC to assemble and adopt SOPs and plan space needs	To be determined
7.1.4 Consequences of changes	
To be determined	To be determined
7.1.5 Financial model	
To be determined	To be determined
7.2 New faculty building	
To be determined	To be determined

Table 7: Milestones

Conducting Clinical Trials Problems to avoid

Asbjorn Jokstad

Avoid problems with design

- inferior design
 - opens for investigator bias
 - over-optimistic results
 - publication bias
 - pre-existing data presented as “experimental”
 - choice of sample
 - different observers
 - sample size
-

Avoid problems with execution

- Adherence to protocol
 - Missing data
 - Randomization
-

Avoid problems with analysis

- ❑ analysis methods when assumptions not met
 - ❑ analysing paired data ignoring pairing
 - ❑ failing to take into account ordered categories
 - ❑ treating multiple observations on one subject
 - ❑ multiple paired comparisons
 - ❑ within-group and subsequent between-gr compar.
 - ❑ CI include impossible values
 - ❑ correlation instead of comparison
 - ❑ correlation of two time-related observations
 - ❑ diagnostic test solely on sensitivity/specificity
 - ❑ using subsets of participants
-

Avoid problems with presentation

- SE or CI for descriptive data
 - presenting means without variability
 - results of stat. analyses solely as P value
 - spurious precision versus no precision
 - graphical presentation tricks
 - zero on axis -- change of scale in axis ---3D
 - coincidence in scatterplots -- regression without scatter
 - superimposing different scales --- plotting means wo. var.
-

Avoid problems with interpretation

- P is not the probability that the observed effect is due to chance, but the probability of obtaining the observed effect when the null hypothesis test is true. (i.e. when there is no such differences in the population)
 - $P = .001$ is not a “stronger” effect than $P = .01$
 - P levels are not absolute yes/no limits.
 - Association and causation is not identical
 - The study sample must be representative
-

Avoid problems with omission

- If important information is lacking in the text it is assumed that invalid procedures have been used.
 - Use a checklist!
-

Research equipment and – facilities relevant to clinical research

General

- Sterilization and glasswashing rooms
- water purification systems
- storerooms for glassware, supplies and chemicals
- Walk-in cold room to store materials, reagents with bench space
- Sample storage facilities that may include liquid nitrogen storage containers, -90 degree freezers and other freezers

Dental biomaterials

- Computer driven Materials Testing System, enabling automated testing of tensile compression and flexing, fatigue and resilience.
- Induction casting machine
- potentiostat
- gold film mercury detector
- thermocycler
- Grinder polishers
- Economent
- Isomet saws and a high speed saw are used to prepare and examine biomaterials.
- A Harrick plasma cleaner to prepare surfaces for comparisons of interactions with biological materials

Cariology and microbiology

- Hard tissue microtomes
- Polarized light microscopes for mineralized tissue preparation and evaluation.
- A microprocessor based system that enables research requiring automated titration, pH stat or chemostat conditions
- Atomic absorption spectrophotometer for elemental analysis.
- Equipment necessary to grow and maintain anaerobic and aerobic cultures
- Fermenter for large-scale cultures
- Scientific anaerobic chambers
- Spectronic spectrophotometers
- nephelometer
- pH meter
- gyratory shaking water bath
- CO2 incubators
- 37° incubator
- spiral plater system

- A biological safety hood and associated support equipment available for projects requiring the use of potential pathogens

Histology/ultrastructure

- Equipment and facilities for light microscopy and electron microscopy.
- Sample preparation area including cryostats, fume hoods, ventilated enclosed bench areas, automated tissue processors, wax embedder sectioning instruments microtomes, critical point dryers & vacuum sputter coater
- Photomicroscopes for light microscopy that include fluorescence, dark field, light field, polarizing and phase contrast
- A scanning electron microscope with an x-ray analysis detector supervised and maintained by a certified electron microscopist
- A transmission electron microscope supervised and maintained by a certified electron microscopist

Tissue culture

- Facilities permitting preparation and maintenance of primary isolates, organ cultures, and long-term cultures
- Facilities permitting preparation production of monoclonal antibodies
- Incubators and laminar flow safety hoods for tissue preparation and cell, tissue, or organ culture

Oral soft tissue

- Perfusion chambers for isotopic measurements of molecular flow across tissues
- Sorvall tissue chopper and Sherwood vibratome for sectioning unembedded soft tissues.
- Equipment for lipid analysis by thin layer chromatography,
- high pressure chromatography gas chromatography.
- N-evap for drying samples
- rotary evaporator
- fume hood for prep work and an acid resistant hood for sulfuric acid spraying.
- Gyrotory shakers
- electrophoresis equipment (vertical and horizontal units)
- ultraviolet transilluminate camera with hood
- camera for photodocumentation of nucleic acids
- GTI/Spectrovision FD-500 fluorimeter
- Labconco Centrivap concentrator.

Molecular biology and biochemistry

- UV and visible light spectrophotometers

- Coulter counter
- gas chromatographs
- ultracentrifuge
- gamma and scintillation counters
- Gell electrophoresis equipment for molecular biology, including for probe preparation and identification equipment

Image analysis core equipment

- Automated image analysis capable of analyzing real-time video images obtained from a microscope slide, a scanning electron microscope or flatbed image sources.
- Software that provides statistical analysis and downloading of data to spreadsheet programs or other statistical software.
- Sonic digitizer to manually trace flatbed images or 35 mm transparencies
- Polarized light microscope and Image Pro Plus image analysis system to digitize and analyse polarized light images of mineralized tissue
- High resolution camera,
- Monitors
- Dedicated PCs.
- Possibility to archive to compact disc or transferred to any networked PC for further analysis or statistical evaluation digitized polarized light or conventional light images and any measurements derived from images
- Transilluminators
- PhotoDocumentation camera systems.

Statistical consulting and grant preparation

- Statistician for gathering pilot data and for planning projects for submission of externally funded grant applications.
- Assistance with proposal writing and budget preparation

TC106 Standards

Title	Standard	convenor	Workgroup
Dental equipment -- Graphical symbols	ISO 9687:1993		?
Dental CAD/CAM Systems		/van der Zel	SC1/SC2/SC4/SC6
Dentistry -- Zinc oxide/eugenol and zinc oxide/non-eugenol cements	ISO 3107:2004	SA/ ND Ruse	SC1/WG1 zinc oxide/eugenol cements and non-eugenol cements
Dentistry - Water-based cements -- Part 1: Powder/liquid acid-base cements	ISO 9917-1:2003	BSI	SC1/WG10 Dental luting cements, bases and liners
Dentistry- Water-based cements -- Part 2: Resin modified cements	ISO 9917-2:1998	BSI/ J McCabe	SC1/WG10 Dental luting cements, bases and liners
Dental Materials- Requirements and test methods for dental water-based cements Part 3 Self-curing resin-modified cements	ISO 9917-3:xxx	BSI	SC1/WG10 Dental luting cements, bases and liners
Dental materials -- Testing of adhesion to tooth structure	ISO/TS 11405:2003	SN	SC1/WG11 Adhesion test methods
Dentistry – Orthodontic Products: Wires	ISO 15841	/J Horn	SC1/WG13 Orthodontic products
Dentistry-Orthodontic Products Part 2: Elastomeric Auxilliaries	ISO 21606	/P Brockhurst / ND Ruse	SC1/WG14 Orthodontic elastics
Dental absorbent points	ISO 7551:1996	BSI /G Wilson /ND Ruse	SC1/WG2 Endodontic materials
Dental root-canal obturating points	ISO 6877:1995	BSI /G Wilson /ND Ruse	SC1/WG2 Endodontic materials
Dental root canal sealing materials	ISO 6876:2001	BSI /G Wilson /ND Ruse	SC1/WG2 Endodontic materials
