## Academy of Osseointegration Symposium

Esthetic outcomes for single implants in the anterior maxilla and dimensions of the peri-implant hard and soft tissues

Dr. Asbjørn Jokstad

Academy of Osseointegration 2017 ANNUAL MEETING March 15-18 Orlando

---

---

---

---

---

---

---

---

Greetings from: Tromsø UiT The Arctic University of Norway

2005-2013: Head of prosthodontics, University of Toronto, Canada  
2013 - current: Clinical Dentistry, University of Tromsø, Norway

Academy of Osseointegration 2017 ANNUAL MEETING March 15-18 Orlando

---

---

---

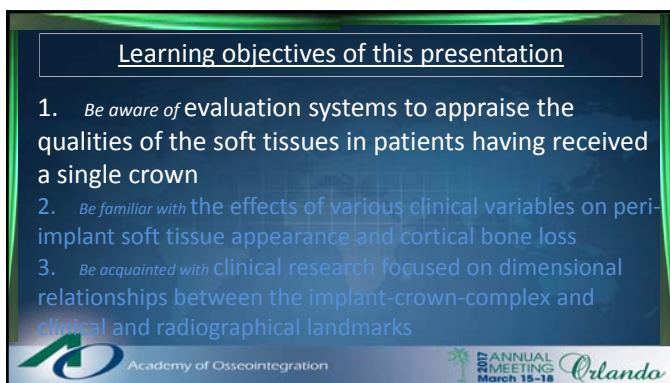

---

---

---

---

---

### Learning objectives of this presentation

1. *Be aware of* evaluation systems to appraise the qualities of the soft tissues in patients having received a single crown
2. *Be familiar with* the effects of various clinical variables on peri-implant soft tissue appearance and cortical bone loss
3. *Be acquainted with* clinical research focused on dimensional relationships between the implant-crown-complex and clinical and radiographical landmarks

Academy of Osseointegration 2017 ANNUAL MEETING March 15-18 Orlando

---

---

---

---

---

---

---

---

1. Evaluation of esthetic outcomes

A satisfactory esthetic outcome?

Academy of Osseointegration 2017 ANNUAL MEETING March 15-18 Orlando

---

---

---

---

---

---

---

---

A satisfactory esthetic outcome?

High smile line

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## 2. Evaluation of esthetic outcomes in implant dentistry

Established evaluation system  
 1971 USPHS / Ryge criteria - "US Public Health Service" (Cvar & Ryge)  
 1977 CDA criteria - "California Dental Association"

**Categorical levels:**  
 Alfa - Bravo - Charlie - Delta  
 Romeo - Sierra - Michigan - Tango - Victor

---

---

---

---

---

---

---

---

## 2. Evaluation of esthetic outcomes in implant dentistry

Established categorical evaluation system  
 1971 USPHS criteria - "US Public Health Service" (Cvar & Ryge)  
 1977 CDA criteria - "California Dental Association"

Specifically to implant-retained reconstructions in the esthetic zones  
 2005 ICAI - "Implant Crown Aesthetic Index" (Meijer et al. COIR)

<p><b>1&amp;2 Position of mucosa in the approximal embrasures:</b> must be in their natural position, 3-points (deviation &gt;1.5 mm- &lt;1.5 mm- no deviation)</p> <p><b>3 Position of the labial margin of the peri-implant mucosa:</b> must be at the same level as the contralateral tooth and in harmony with the adjacent teeth, 3-points (deviation ≥1.5 mm- &lt;1.5 mm- no deviation)</p> <p><b>4&amp;5 Contour of the labial surface of the mucosa:</b> must be in harmony with the adjacent and contralateral tooth, 5-points (gross - slight undercontoured - no deviation - slight - gross overcontoured)</p> <p><b>6&amp;7 Colour and surface of the labial mucosa:</b> must be in harmony with the adjacent and contralateral tooth and must have a natural appearance, 3-points (gross - slight - no mismatch)</p>	<p><b>1. Mesiodistal dimension of the crown:</b> must be in harmony with the adjacent and contralateral tooth, 5-points (gross - slight undercontour- no deviation - slight - gross overcontour)</p> <p><b>2. Position of the incisal edge of the crown:</b> must be in harmony with the adjacent and contralateral tooth, 5-points (gross - slight undercontour- no deviation - slight - gross overcontour)</p> <p><b>3. Labial convexity of the crown:</b> must be in harmony with the adjacent and contralateral tooth, 5-points (gross - slight undercontour- no deviation - slight - gross overcontour)</p> <p><b>4. Colour and translucency of the crown:</b> must be in harmony with the adjacent and contralateral tooth, 3-points (gross -slight -no mismatch)</p> <p><b>5. Surface of the crown:</b> characteristics of the crown such as roughness and ridges must be in harmony with the adjacent and contralateral tooth, 3-points (gross -slight -no mismatch)</p>

## 2. Evaluation of esthetic outcomes in implant dentistry

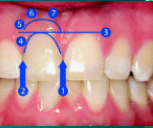

Established categorical evaluation system

1971 USPHS criteria - "US Public Health Service" (Cvar & Ryge)  
 1977 CDA criteria - "California Dental Association"

Specifically to implant-retained reconstructions in the esthetic zones

2005 ICAI - "Implant Crown Aesthetic Index" (Meijer et al. COIR)  
 2005 PES - "Pink esthetic score" (Fürhauser et al. COIR)

Variable		0	1	2
Mesial papilla	Shape vs. reference tooth	Absent	Incomplete	Complete
Distal papilla	Shape vs. reference tooth	Absent	Incomplete	Complete
Level of soft-tissue margin	Level vs. reference tooth	Major discrepancy >2 mm	Minor discrepancy 1-2 mm	No discrepancy <1 mm
Soft-tissue contour	Natural, matching reference tooth	Unnatural	Fairly natural	Natural
Alveolar process	Alveolar process deficiency	Obvious	Slight	None
Soft-tissue color	Color vs. reference tooth	Obvious difference	Moderate difference	No difference
Soft-tissue texture	Texture vs. reference tooth	Obvious difference	Moderate difference	No difference

From: Fürhauser et al. 2005

---

## 2. Evaluation of esthetic outcomes in implant dentistry

Established categorical evaluation system

1971 USPHS criteria - "US Public Health Service" (Cvar & Ryge)  
 1977 CDA criteria - "California Dental Association"

Specifically to implant-retained reconstructions in the esthetic zones

2005 ICAI - "Implant Crown Aesthetic Index" (Meijer et al. COIR)  
 2005 PES - "Pink esthetic score" (Fürhauser et al. COIR)  
 2009 PES/WES - "Pink and white esthetic score" (Belser et al. J. Perio)  
 2010 CEI - "Complex esthetic index" (Juodzbalsys & Wang J. Perio)

Findings and Evaluation Guides			
Findings	Maximum score	Findings	Maximum score
1. Soft tissue color (index)	0-4	1. Tooth Form	0-2
2. Soft tissue contour (index)	0-2	2. Outline/Volume	0-2
3. Alveolar process deficiency (index)	0-2	3. Color (Duck/Suab)	0-2
4. Hard Consistency/Soft Tissue Color and Texture (index)	0-2	4. Surface Texture	0-2
5. Translucency/Characterization (index)	0-2	5. Translucency/Characterization	0-2

(S): soft tissue index  
 (P): predictive index ("Bone")  
 (R): implant-supported restoration index

---

---

---

---

---

---

---

---

---

---

### Measure of degree of perfection vs. reality ?

Criteria for scoring esthetical outcome may at times create a challenge  
 The single implant-supported crowns "stand out positively", but should per definition be scored "low" because they do not blend in with the remaining teeth and gingiva contours

15-20 yr old implant-crowns  
 Jokstad et al. IJOMI 2016 (in press)

Academy of Osseointegration

---

---

---

---

---

---

---

---

---

---

### 2. Evaluation of esthetic outcomes in implant dentistry

Established categorical evaluation system

- 1971 USPHS criteria - "US Public Health Service" (Cvar & Ryge)
- 1977 CDA criteria - "California Dental Association"

Specifically to implant-retained reconstructions in the esthetic zones

- 2005 ICAI - "Implant Crown Aesthetic Index" (Meijer et al. COIR)
- 2005 PES - "Pink esthetic score" (Fürhauser et al. COIR)
- 2009 PES/WES - "Pink and white esthetic score" (Belsler et al. J.Perio)
- 2010 CEI - "Complex esthetic index" (Juodzbalys & Wang J.Perio)

Specifically to implant-retained reconstructions and papillae

1997 PI - "Jemt) Papilla Index" score (Jemt Int. J. Per. Res. Dent)

i.e., position of the soft-tissue crest relative to the apical location of the tooth:implant-crown contact area

Score: 0 (1) (2) (3) (4)

Academy of Osseointegration

2017 ANNUAL MEETING March 15-18 Orlando

---

---

---

---

---

---

---

---

---

---

### Learning objectives of this presentation

1. Be aware of evaluation systems to appraise the qualities of the soft tissues in patients having received a single crown
2. Be familiar with the effects of various clinical variables on peri-implant soft tissue appearance and cortical bone loss
3. Be acquainted with clinical research focused on dimensional relationships between the implant-crown complex and clinical and radiographical landmarks

---

---

---

---

---

---

---

---

---

## 2. Effects of clinical variables on peri-implant soft tissue appearance and cortical bone loss

We may today expect predictable esthetic outcomes due to refinements over the years:

- Alternative surgical and restorative treatment strategies
- Innovative implant system components and biomaterials

Academy of Osseointegration  
2017 ANNUAL MEETING March 15-18 Orlando

---

---

---

---

---

---

---

---

---

---

---

## Alternative surgical and restorative treatment strategies

© 2009 International Team for Implantology

Timing of implant placement				Loading protocol alternatives	
Classification	Descriptive Terminology	Period after Tooth Extraction	Desired Clinical Situation at Implant Placement	Loading Protocol	Definition
Type 1	Immediate placement	Immediately following extraction	Post-extraction site with no healing of bone or soft tissues	Immediate restoration	A restoration is inserted within 48 hours of implant placement, but not in occlusion with the opposing dentition
Type 2	Early placement with soft tissue healing	Typically 4 to 8 weeks	Post-extraction site with healed soft tissue but without significant bone healing	Immediate loading	A restoration is placed in occlusion with the opposing dentition within 48 hours of implant placement
Type 3	Early placement with partial bone healing	Typically 12 to 16 weeks	Post-extraction site with healed soft tissues and with significant bone healing	Conventional loading	The prosthesis is attached after a healing period of 3 to 6 months
Type 4	Late placement	Typically 6 months or longer	Fully healed post-extraction site	Early loading	A restoration in contact with the opposing dentition is placed at least 48 hours after implant placement but not later than 3 months afterwards
				Delayed Loading	The prosthesis is attached in a procedure that takes place some time later than the conventional healing period of 3 to 6 months

## Alternative surgical and restorative treatment strategies for healed sites / missing teeth

Academy of Osseointegration  
2017 ANNUAL MEETING March 15-18 Orlando

---

---

---

---

---

---

---

---

---

---

---

---

### 90ies advices for placement (in a healed site)

Place as vertically as possible (avoid non-axial loading!)

+ buccal grafting  
OR  
place palatally to make "ridge-lap crown"

Academy of Osseointegration  
2017 ANNUAL MEETING March 15-18 Orlando

---

---

---

---

---

---

---

---

---

---

### 90ies advices for placement (in a healed site)

Place as vertically as possible (avoid non-axial loading!)

+ buccal grafting  
OR  
place palatally to make "ridge-lap crown"

OR  
Place in the centre axis of the remaining alveolar bone → often angulated abutment need

Academy of Osseointegration  
2017 ANNUAL MEETING March 15-18 Orlando

---

---

---

---

---

---

---

---

---

---

### Alternative surgical and restorative treatment strategies for remaining hopeless tooth / root

1	Remaining tooth extracted +/- augment	Heal +/- 3 mths	Implant placed +/- augment	Heal +/- 4 mths	Load Temp./perm. prosthesis		
2	Remaining tooth extracted +/- augment	Heal +/- 3 mths	Implant placed +/- augment	Heal +/- 4 mths	Recovery surgery for esthetics	Soft-tissue building	Load Temp./perm. prosthesis
3	Remaining tooth extracted +/- augment	Heal +/- 3 mths	Implant placed +/- augment & Load Temp./perm. prosthesis				

Academy of Osseointegration  
2017 ANNUAL MEETING March 15-18 Orlando

---

---

---

---

---

---

### Implant placement strategies – immediate or early?

'90ies

1. +/- Augmentation
2. Auto-/allograft
3. +/- membrane
4. ((HA-)cylindric)

Academy of Osseointegration 2017 ANNUAL MEETING March 15-18 Orlando

The diagram shows a cross-section of a jawbone with a gap. A red cylindrical implant is placed in the gap. A dashed line indicates the original bone level. A red outline shows the bone level after the implant is placed, showing some bone growth around the implant. The text '90ies' is written in the top right. A list of four strategies is in the bottom right. The logo for the Academy of Osseointegration and the 2017 Annual Meeting in Orlando are at the bottom.

---

---

---

---

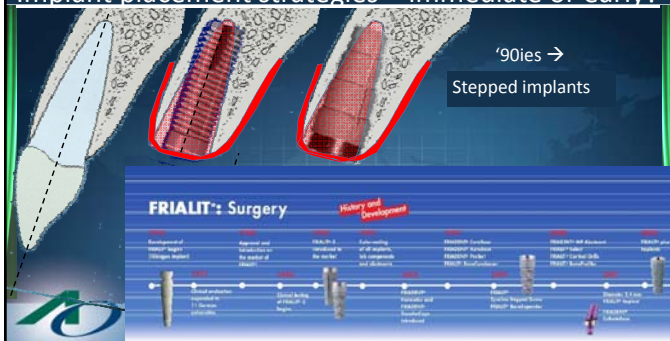

---

---

---

---

### Implant placement strategies – immediate or early?

'90ies →  
Stepped implants

**FRIALIT: Surgery**

History and Development

Academy of Osseointegration 2017 ANNUAL MEETING March 15-18 Orlando

The diagram shows a cross-section of a jawbone with a gap. A red stepped implant is placed in the gap. A dashed line indicates the original bone level. A red outline shows the bone level after the implant is placed, showing bone growth around the implant. The text ''90ies → Stepped implants' is in the top right. Below the diagram is a timeline titled 'FRIALIT: Surgery' and 'History and Development' with various stages and dates. The logo for the Academy of Osseointegration and the 2017 Annual Meeting in Orlando are at the bottom.

---

---

---

---

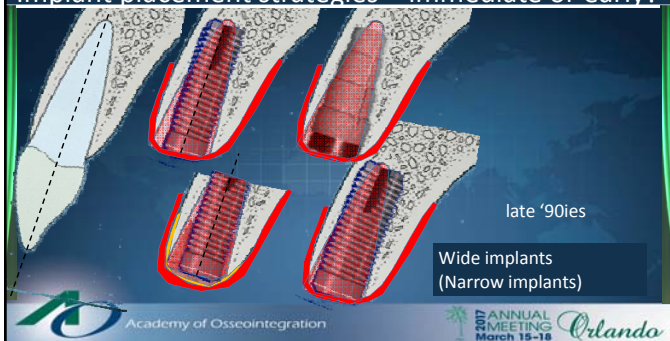

---

---

---

---

### Implant placement strategies – immediate or early?

late '90ies

Wide implants  
(Narrow implants)

Academy of Osseointegration 2017 ANNUAL MEETING March 15-18 Orlando

The diagram shows a cross-section of a jawbone with a gap. A red wide implant is placed in the gap. A dashed line indicates the original bone level. A red outline shows the bone level after the implant is placed, showing bone growth around the implant. The text 'late '90ies' is in the top right. A text box in the bottom right says 'Wide implants (Narrow implants)'. The logo for the Academy of Osseointegration and the 2017 Annual Meeting in Orlando are at the bottom.

---

---

---

---

---

---

---

---

### Implant placement strategies – immediate or early?

2011 → pioneered by U. Bern

1. 4-8 w. healing postextract
2. Tissue-level (→ bone level)
3. Buccal grafts – Auto-+Xenograft particles
4. Collagen membrane
5. Submerge 8-12 w.

Academy of Osseointegration

---

---

---

---

---

---

---

---

---

---

### A deductive reasoning approach

Premise: A 1.5 mm wide “circumferential crater” exists around all implants, including on the buccal side. Hence,

1. ... the bone thickness should be at least 2 mm, preferably 4 mm
2. If < 2mm bone is available, part of the buccal bone plate will be lost after remodeling, with the consequence of a high risk of soft tissue recession
3. Such a large amount of bone buccally does not exist normally, and has to be created with augmentation procedures in almost every esthetically demanding case

*Thickness that bone on buccal side of implant should have to support gingival margin despite horizontal crater formation.*

*Amount of bone needed to accommodate circumferential crater without loss of height in buccal mucosal margin; dotted line = original degree of B-L resorption*

Influential paper  
BUT  
The evidence of the premise is weak  
see: Zhang et al. COIR 2014

From: Grunder et al. IJPRD 2005

---

---

---

---

---

---

---

---

---

---

### “Saucerization” – influence by the implant design?

BioHorizon 4 x 12 mm	3i Osseotite NT 4 x 13 mm	3i Certain Prevail 3.8 x 11.5 mm	Innova Endopore 4 x 9 mm	Brånemark Std. 3.75 x 18 mm	ITI Std.+ Narrow-Neck 3.3 x 12 mm
Replace Select Straight 4.3 x 15 mm	Replace Select Taper 4.3 x 16 mm	Steri-Oss Replace 3.3 x 18 mm	Zimmer ScrewVent-taper 4.7 x 16 mm	Zimmer ScrewVent 3.8 x 16 mm	Zimmer MicroVent 4.3 x 16 mm

---

---

---

---

---

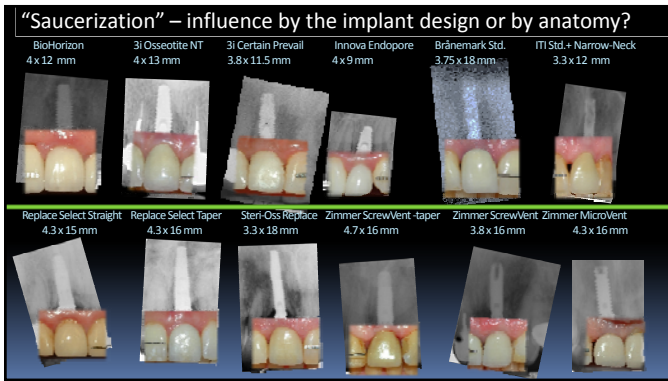

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

**2. Effects of clinical variables on peri-implant soft tissue appearance and cortical bone loss**

We may today expect predictable esthetic outcomes due to refinements over the years:

- Alternative surgical and restorative treatment strategies
- Innovative implant system components and biomaterials

The parameters to achieve the best possible appearance of peri-implant soft-tissues?

Academy of Osseointegration | 2017 ANNUAL MEETING March 15-18 Orlando

---

---

---

---

---

---

---

---

---

---

**Potential effect of site or surgery variables on outcome?**

1. Tissue biotype / thickness
2. Incision / flap design
3. Osteotomy procedure
4. Implant position, vertical & adjacent tissues
5. Torque / primary stability
6. Flap handling
7. Suturing technique
8. Cover screw / tenting abutment

Academy of Osseointegration | 2017 ANNUAL MEETING March 15-18 Orlando

---

---

---

---

---

---

---

---

---

---

**Potential effect of site or surgery variables on outcome?**

1. Tissue biotype / thickness – thin vs thick  
 Thin biotype gingiva is more prone to recession  
 Kan et al. IJOMI 2011

Mucosa thickness over implant may influence crestal bone changes  
 Linkevicius et al. Stomatol. 2009

Lops et al. J.Esth.D 2015  
 da Rosa et al. IJPRD 2014  
 Cardarolopi et al. IJPRD 2015  
 Zuiderveld et al. 2014

---

---

---

---

---

---

---

---

---

---

**Potential effect of site or surgery variables on outcome?**

1. Tissue biotype / thickness – thin vs thick  
 2. Incision / flap design - use  
 1. Trapezoidal instead of intra-sulcular incision (Gomez-Roman IJOMI 2001)  
 2. Split-finger approach (Misch et al. Imp Dent 2004)

---

---

---

---

---

---

---

---

---

---

**Potential effect of site or surgery variables on outcome?**

1. Tissue biotype / thickness – thin vs thick  
 2. Incision / flap design - papilla-sparing approach  
 3. Osteotomy procedure Evidence is inconclusive  
 4. Implant position, vertical & adjacent tissues  
 5. Torque / primary stability Evidence is conflicting  
 6. Flap handling Evidence is inconclusive  
 7. Suturing technique Evidence is inconclusive  
 8. Cover screw / “tenting” abutment Evidence is lacking

If also immediate placement:  
 Extraction reason  
 Extraction technique  
 Socket debridement  
 Socket preservation  
 Evidence is inconclusive, or conflicting or lacking

Keratinized gingiva – Wennström & Derks COIR 2012 Evidence is lacking  
 Crown-implant ratio – Gulje et al. IJOMI 2015 Not likely  
 “Platform-switching” Evidence is conflicting  
 Abutment connect-disconnect Evidence is lacking

---

---

---

---

---

---

---

---

---

---

The SAC Assessment Tool

## SAC Classification –

Straightforward - Advanced - Complex

**General determinants**

1. Esthetic Risk	2. Complexity of Treatment Process	3. Risks of complications and consequences
High	High	High
Low	Moderate	Moderate
	Low	Low

**Modifying Factors**

1. General	2. Esthetic
3. Surgical	4. Restorative

### Buccal bone vz. gingival thickness vz. esthetics?

mm	n	%
1	12	25
2	10	21
3	2	4
4	1	2
5	1	2
Total	45	100

Correlation between buccal bone & gingival thickness is only moderate

Gingival thickness, Thin vs thick biotype

From: De Bruyckere et al. JCP 2015  
Younes et al. COIR 2016

N= 21 pat.

Academy of Osseointegration

2017 ANNUAL MEETING March 15-18 Orlando

---

### Buccal bone vz. gingival thickness vz. esthetics?

COIR LAST ISSUE!

Three-Dimensional buccal bone anatomy and aesthetic outcome of single dental implants replacing maxillary incisors

COIR 2016; 27: 956: "Within present limitations, acceptable and stable aesthetics are not jeopardized by a thin or missing buccal bone"

N= 12 pat.

Association?: NO

BUT!

cbCT accuracy of  $\leq 1.2$  mm peri-implant buccal bone ?

Poor (Schulze et al. 2001)  
Poor (Spin-Netto et al. 2011)  
Poor (Benic et al. 2013)  
Modest (Gonzales et al. 2016)

Academy of Osseointegration

---

---

---

---

---

---

### Summarizing – Take home message

- Evaluation systems to appraise the qualities of the soft tissues in patients having received a single crown  
**PES & PES/WES have been validated and appear to predominate in use**
- The effects of various clinical variables on peri-implant soft tissue appearance and cortical bone loss  
**Effects of many variables singularly and in combination are largely unknown, principally due to small datasets and short study duration**
- Clinical research focused on dimensional relationships between the implant-crown-complex and clinical and radiographical landmarks  
**Cross-sectional studies with simplistic statistics indicate associations, while longitudinal studies with adequate multi-level multivariate statistics provide less conclusive data**
